(57) Abstract :
The invention relates to a system and method for suggesting remedies for psychophysiological genitourinary disorders. The system comprises an input module (202), a suggestion module (204), and an output module (206). The input module (202) receives input queries from the user regarding their symptoms, which are then compared to the prefeed symptoms stored in a database (106) by the suggestion module (204) to determine the severity of the disorder. The suggestion module (204) suggests treatments based on the severity of the disorder, such as yoga asanas, yogic counseling, OM meditation, naturopathy, or a combination thereof. The output module (206) displays the suggested treatments along with images and videos on the user interface of the user device. The system also suggests the user consult with a urogynecologist or urologist through video conference based on the determined severity of the disorder.
