(57) Abstract :

Disclosed herein is an AI-powered land registry system for efficient property management comprises a data acquisition module, configured to collect property-related data from various sources. The system includes a database configured to store and manage property-related data. The system also includes an artificial intelligence engine, configured to analyze the property-related data stored in the database, and generate insights for property management. The system also includes a user interface configured to enable users to interact with the system, view property information, and perform queries related to property ownership, transactions, and valuations. The system also includes a blockchain-based verification module, configured to authenticate and validate property records and transactions. The system also includes a recommendation engine configured to provide property management suggestions. The system also includes a communication interface, configured to integrate with external systems for exchanging property-related data with government authorities, financial institutions, and other stakeholders.
